ABSTRACT

Taking care of our skin is essential for preserving its health, appearance, and overall well-being. Due to their increasing popularity, skincare products have become one of the solutions for various skin concerns. The magic behind these products lies in their ingredients carefully chosen for their targeted actions against issues like excess sebum production or acne treatment. Additionally, there is a trend towards utilizing elements in cosmetic formulas. These natural ingredients offer benefits to skincare products while minimizing the risk of side effects. As a result, research and development efforts are continuously focused on discovering actives and innovative formulations that deliver performance and efficacy under the guidance of scientists and product development experts. Following a skincare regimen provides the foundation for maintaining radiant skin, which has numerous benefits. It's crucial to understand that skincare isn't a one-size-fits-all approach, everyone has skin types. Skin types can range from dry to oily or combination and common skin issues include acne, eczema, and hyperpigmentation (darkening), among others. Once you've identified your skin type and targeted concerns it's essential to select products. Skincare products encompass cleansers, toners, moisturizers, and more. It is crucial to be aware of the substances you apply to your face and ensure that they cater to your skin's needs. Additionally, it is essential to know how to combine products that contain ingredients to prevent any allergic reactions or irritation on the skin. There are ingredients commonly found in skincare products, such as retinol, vitamin C, and alpha hydroxy acids. Each of these ingredients serves a purpose, in the realm of skincare.

Keywords: Skin care, Skin types, Acne, Hyperpigmentation, Moisturizers, Cleansers, Serum

INTRODUCTION

The skin, the largest organ of the human body, performs a vital function in protecting the body from external hazards and preserving overall homeostasis. The complex physiology of the skin supports a variety of protective, sensory, and regulatory functions. The skin is composed of three major layers: the epidermis, dermis, and hypodermis, each having unique structures and functions (1). Keratinocytes make up the majority of the outermost layer, the epidermis, and they are constantly renewing to provide a strong barrier against pathogens and physical harm (2). The dermis, which lies beneath the epidermis, contains blood vessels, nerves, and connective tissue that aid in thermoregulation and provide mechanical support (3). Insulating the body and acting as an energy reserve is the innermost hypodermis, which is primarily composed of adipose tissue (4) To develop advanced methods of treatment for several kinds of dermatological disorders, it is essential to understand the complicated anatomy and physiology of the skin.

Fig1 Anatomy of Skin(5)

Skincare is not just a beauty trend; it's a science that involves understanding various products, ingredients, and the importance of following a skincare routine. Skincare products are carefully formulated with specific ingredients that target different skin concerns(6).

These ingredients, whether natural or synthetic, have specific functions and effects on the skin. Understanding the science behind skincare allows individuals to make informed choices about the products they use and develop a personalized skincare routine that addresses their specific needs.

By using the sources provided, one can gain valuable insights into the world of skincare and its scientific foundations. By referring to these sources, individuals can better understand how skincare products work, the benefits of different active ingredients, and the potential risks associated with certain ingredients or skincare practices. By incorporating green skincare products into their routine, individuals can prioritize natural, botanical-based ingredients that are free from synthetic chemicals, reducing the risk of adverse reactions and long-term toxicity(7). By being aware of the potential risks associated with certain skincare ingredients and practices, individuals can make more informed choices regarding their skincare routine and prioritize products that are applied to the skin.

DIFFERENT TYPES OF SKIN

Your skin type is significantly affected by how well your natural skin barrier functions, especially in terms of moisture and water content. If your skin barrier fails to function properly, it might fail to produce enough lipids or retain enough water to keep skin supple and firm, causing dry skin. On the other side, producing too many lipids or natural oils, such as sebum, might result in oily skin.

Also, this natural barrier safeguards skin from external irritants, and when it is inadequate, skin becomes more sensitive. While the skin barrier has hereditary predispositions, environmental variables such as cosmetics, air pollution, weather, and UV radiation can all have an impact on it. Understanding your skin type is a vital initial step towards establishing a tailored skincare routine(8).

It is essential to identify your specific type to determine which skincare ingredients and treatments are appropriate for you, as well as the ones to avoid. While genetics influence skin type, extrinsic variables such as nutrition, stress, and ultraviolet radiation can have an impact. Skin types may alter over time, becoming increasingly dry with age(6).

The five fundamental varieties of skin types are.

- a. **Normal skin type:** Normal skin is harmonious skin that is not exceedingly dry or oily, is not exceptionally sensitive, and has very limited skin flaws. Normal skin is believed to be the best skin type for skincare because of its small pores, uniform skin tone, and soft texture.
- b. **Dry skin type:** Dry skin can be caused by flaws with the skin's moisture barrier as well as external variables such as chilly weather and exaggerated washing. Dry skin is evaluated on a scale. While it is widely recognized for its rough texture, it's known to flake, peel, or even break at some time. To effectively care for dry skin, you have to implement a skincare routine that concentrates on hydrating and moisturizing the skin(7).
- c. **Oily skin type:** Excess sebum secretion is a prevalent root of oily skin. Internal biology-related factors, as opposed to extrinsic biological variables, are most frequently responsible. Certain individuals, for instance, have a familial tendency to generate more sebum than others; hormonal fluctuations, which tend to occur during puberty, may trigger an increase in sebum production. Overproduction of oil may trigger an oily appearance, deeper pores, and a higher probability of acne and blackheads. Oily skincare products attempt to regulate sebum production, lessen shine, and prevent breakouts(6).
- d. **Combination skin type:** There are two kinds of combination skin: oily and normal or dry. Combination skin comprises an oily T-zone (forehead, nose, and chin) and various other parts that are medium to dry. The T-zone tends to be oilier due to a greater concentration of oil glands. Although anyone may experience dry or oily skin for a variety of reasons, individuals with combination skin are inclined to have the same dryness and oiliness at frequent intervals. The T-zone tends to be smooth and glossy, but the remaining part of the face is rough and dismal(9).
- e. **Sensitive skin type:** Skin sensitivity is occasionally ascribed to a compromised barrier property of the skin or an inflamed immune system. Certain irritants, as well as an acquired inclination, could trigger it. Dry skin fosters a greater vulnerability because it compromises the skin's natural protective barrier. Natural reactions and toxins such as animal dander, pollen, and cosmetics may induce or enhance sensitivity. Skin sensitivity varies from insignificant to profound, displaying blotchiness, redness, peeling, itchiness, or blistering. If skin care products or specific materials aggravate your skin or if you gain dermatitis through contact easily, you undoubtedly have sensitive skin(9).

Skin Type	Characteristics	Care Routine
Normal Skin	Smooth, clear, not sensitive	Gently cleanse and moisturize regularly. Consider using vitamin C serum and products with alpha-hydroxy acid.
Dry Skin	Flaky, rough, itchy	Cleanse gently, avoid harsh drying ingredients, and moisturize regularly. Look for products with hydrating ingredients.
Oily Skin	Shiny, greasy texture, large pores	Use strong cleansers and toners to reduce shine. Moisturize lightly with non-comedogenic products.
Combination Skin	Dry in some areas (cheeks), oily in others (T-zone)	Cleanse, tone, and hydrate according to different needs. Avoid strong cleansers on dry areas and heavy moisturizers on oily areas.
Sensitive Skin	Easily irritated after washing or applying products	Use gentle products formulated to avoid irritation. Look for ingredients like ceramides, green tea, and squalane.

Table 1. Skin Types, Their Characteristics, and Recommended Skincare Routines

HISTORY OF SKINCARE

Since the dawn of time, numerous cultures have created distinct skincare routines and have produced or made various products to keep the skin clean and perfect. Human skin has been cared for across the world for as long as humans have had skin. In conclusion, skincare, skin routines, and products have been accessible for a long time(8).

SKINCARE IN AFRICA

African skincare practices date back several thousand years. Africans depended on Mother Nature to care for their skin by employing natural ingredients. People in Africa have used organic products such as shea butter made from the shea tree for hydrating the skin, which reduces dryness and enhances the youthful skin complexion, and African black soap made from the skins of plantain and cocoa pods to cleanse the skin to maintain flawless skin, and neem oil made from the leaves of neem trees to ease inflammation and avoid breakouts in their skincare routines.

SKINCARE IN INDIA

Sandalwood, a multipurpose skincare ingredient used for cleaning, hydrating, and UV protection, is central to ancient Indian beauty secrets. Sandalwood oil has a calming effect(10). Ayurveda, an ancient Hindu medical discipline, pressures overall health via the utilization of herbs and yoga. Additionally, cold cream was developed in this part of the world by blending rose oil, water, and melted beeswax. Ayurvedic beauty routines implemented palatable nourishing plants and oils like neem and turmeric in masks and creams that purify the skin(11). Indians valued rejuvenation and well-being in the Indus Valley, incorporating herbal waters, powders, and oils in their everyday skincare routine. These approaches, which integrate organic components with an all-encompassing dedication to good health, reflect the ongoing relevance of Indian beauty rituals.

THE DEVELOPMENT OF THE FIRST COMMERCIAL SKINCARE PRODUCTS.

In the 1800s people around the world witnessed the emergence of what's believed to be the ever commercially available skincare products. These products included creams, ChapSticks, balms, and basic soap facewashes. Unfortunately, the exact identity of the skincare product on the market remains unclear. However, many speculate that it might have been an organization called Shiseido, which began producing cosmetics in 1897(10).

Before this time most individuals relied on remedies. Applied food-based substances are known for their moisturizing, antibacterial, or soothing properties to take care of their skin. It wasn't until the 1900s that entrepreneurs and factory owners started manufacturing and distributing these products on a scale worldwide. This marked the establishment of the skincare industry as we know it today(4).

THE RISE OF CONTEMPORARY SKINCARE PRODUCTS

The first decade of the 1900s saw tremendous growth in the utilization of cosmetics and skincare products, in addition to an enormous spike in their overall recognition, since they became less costly and more readily available - no longer a luxury afforded only to the most affluent, and no longer restricted to women(12).

Contemporaries in the skincare sector are swamped with an array of skincare products from a variety of businesses providing to all skin types and needs, featuring formulae designed specifically for indigenous skin. A contemporary skincare regimen, at its fundamental level, comprises a few procedures: daily cleansing, moisturizing, sunscreen application, and the incorporation of specialist treatments to accomplish specific skincare targets(2).

SKINCARE AND SKIN CONCERNS

SKINCARE

Skincare, as the name implies, is a process of treating and caring for skin. This can be achieved by applying goods (creams, emollients, etc.), nutrition, and food to support skin health and lifestyle practices (avoiding exposure to sunlight). There are many types of skincare, including procedures that can be done at home and medical procedures performed by certified dermatologists. The major objective of skin care is to maintain and improve the appearance of the skin while satisfying certain demands. typical desires include anti-aging, acne reduction, scar fading, and skin tone leveling(13).

SKIN CONCERNS

This depicts a wide range of skin problems varying from little red pimples to extensive rashes. Some skin conditions are unsettling but not harmful, while others are communicable. Many skin-related issues are also bothersome or unsettling. There are several skin concerns in the world today, but we will focus on the most prevalent ones. The most prevalent skin concerns are Acne, dark circles, dark spots, dry skin, oily skin, Hyperpigmentation, and Wrinkles(14).

TYPES OF SKINCARE PRODUCTS

A wide range of products are used in modern skincare routines to treat different skin issues and improve overall skin health. Cleansers are the cornerstone because they efficiently eliminate debris, cosmetics, and pollutants without weakening the skin's natural barrier. They come in a variety of forms, from mild foaming formulas to oil-based solutions(13). Alpha- and beta-hydroxy acids (AHAs) and other chemical exfoliants, as well as mechanical scrubs, are examples of exfoliants that encourage cell turnover and smooth skin texture (15). Maintaining skin hydration and barrier function requires the use of moisturizers, which are frequently enhanced with hydrating substances including hyaluronic acid, glycerin, and ceramides (16). According to Brennan and Hadley(17), serums are light-textured products that target specific issues like aging, pigmentation, and acne. They also contain high concentrations of active ingredients such as vitamin C, retinoids, and peptides. In order to prevent photoaging and skin cancer, sunscreens are essential for shielding the skin from damaging UV radiation. They come in chemical and physical formulations (18). To further improve the overall effectiveness of a skincare regimen, specialty treatments such as masks, eye creams, and spot treatments provide focused care for more particular problems.

4. ACTIVE INGREDIENTS IN SKINCARE PRODUCTS

Active ingredients have been proven to have biological effects on the skin based on scientific evidence. There are over 20 active ingredients, but we are going to look at the most used ingredients in skincare and the ones that consumers go for most of the time(11).

HYALURONIC ACID: This substance has gained popularity in recent years due to its capacity to absorb and maintain moisture within the skin; it has a very good moisturizing effect and aids in the retention of active compounds within the skin's hydrating layers. This chemical is commonly found in treatments designed for dry skin, aged skin, and eczema-prone skin. Although the skin produces hyaluronic acid, its production decreases considerably in your thirties(19).

NIACINAMIDE: It is also known as vitamin B3 and is used to enhance the appearance of pores, even out skin tone, treat hyperpigmentation, and minimize wrinkles. Niacinamide can also be used to treat acne and rosacea since it helps to battle irritation. This is also beneficial for persons with sensitive skin, although it can be used by anyone with the skin as mentioned above problems(11).

VITAMIN A/RETINOL: This helps to decrease the indications of aging by smoothing and firming the skin. Retinol is a vitamin A derivative that aids in cell turnover, oil production regulation, and collagen formation. Because this is a complex ingredient, it is best to use it in small doses until your skin becomes adapted to it. Start with twice a week and gradually increase to seven times per week. They can be used during the day, but be careful and wear sunscreen, and at night, depending on the other substances in your routine. It can also be used to treat acne, lighten the skin, and hyperpigmentation(10).

VITAMIN C: This is the only antioxidant that has been shown to increase collagen and elastin formation, reduce hyperpigmentation, fight age-accelerating free radicals, and deflect harmful UV rays away from the skin. It is also known to promote skin brightness and allow skin to glow; it is suitable for all skin types(20).

CERAMIDE: Ceramide protects the skin barrier from irritants while retaining moisture. Unfortunately, ceramide can be ripped off the skin by using hot water, certain soaps, stress, and other environmental factors, but using products containing ceramide can help rebuild it. Ceramides are excellent for all skin types because they are a natural component of the skin(10).

ALPHA HYDROXY ACID (AHAs): As previously stated, AHAs are gentle chemical exfoliants that are beneficial for brightening, smoothing, anti-aging, and acne prevention. Glycolic acid and lactic acid are the most frequent AHAs. These are typically utilized in the evening ritual. AHAs have been thoroughly explained in previous chapters; here is a summary(15).

GLYCOLIC ACID: Glycolic acid, which is derived from sugarcane is widely recognized as one of the used AHAs (Alpha Hydroxy Acids). It is good for hyperpigmentation, reduction of aging signs, skin brightening, and dark spots. The effects of glycolic acid depend on the concentration, over-the-counter products usually range from 5% to 7% and the highest is 10% and should be used a few times a week. However, chemical peels using glycolic acid range in amount from 20% to 70% and are only available in a dermatologist's office. People with dry or sensitive skin should start modest and with low-concentration products(21).

LACTIC ACID: Another popular AHA, it is also a natural byproduct of plant and dairy fermentation, helps to boost up dull complexions, and works as an exfoliant to eliminate cell debris, helps unclog pores, and treat acne, it is also hydrating and helps to improve one's appearance of wrinkles over time, it is appropriate for dry and sensitive skin. Many lactic acid-containing products can be used daily to improve rough and dry skin and preserve soft and smooth skin(10).

SALICYCLIC ACID: It is a component of BHA and a well-known over-the-counter product. It is frequently used to treat non-inflamed breakouts and blackheads, and it also aids in the removal of excess oil from the skin. It aids in the unclogging of pores, resulting in smoother, brighter, and healthier skin(1).

KOJIC ACID: Kojic acid is a byproduct of various food fermentations, such as Japanese sake, soy sauce, and rice wine. It is generated by several types of fungi. Because kojic acid helps avoid the formation of tyrosine, an amino acid that creates melanin, it has a lightening effect. It is mostly employed as a lightening agent and has a concentration of 1% or less in products(15).

RESEARCH METHODOLOGY

The survey was used to check with people both male and female of various nationalities the skincare routine they follow, the skincare products they prefer using, their general skin health, and on what basis they would buy their skincare products based on ingredients or popularity in the market.

A Google sheet was used to conduct the survey. The target was to know if people understood the need and basics of skincare if they take their skincare routine seriously and if they use skincare products also there were a total of 27 questions to cover this. A total of 211 people responded.

RESULTS & CONCLUSION

Fig. 2: Selection of skincare Products based on Age.

Fig.9: Usage of supplements for Skincare.

Fig.10: Types of supplements used for skincare.

Fig.11: Population focusing on Internal Skin health.

Fig. 12: Population Consuming Natural Antioxidants in the Diet.

Fig. 13: Detoxification for improving skin health.

Fig. 14: Effect of sunburn on different parts of the body.

Fig. 15: Skin allergies by usage of marketed skincare products.

Fig. 16: Choice of skincare products.

Fig. 17: Usage of home remedies for skincare.

Fig.18: Importance of skincare products.

The importance of skincare products measuring the significance of skincare to participants on a scale from 1 to 10 is shown in Fig 18 along with extra-qualitative replies. A sizable majority of respondents believe skincare to be extremely important, as seen by the data's strong tilt towards the higher end of the scale. In particular, the choice with the highest frequency, a rating of 9, is selected by 74 respondents (35.1%), while 44 respondents (20.9%) choose a rating of 8. This suggests that skincare is very important and is widely agreed upon.

Fig. 19: Brands of skincare often used by the population

Significant differences in brand preference and usage are shown in Fig 19, which displays a survey on the range of skincare brands used by a sample population. Interestingly, Nivea is the most often chosen option, as indicated by the roughly 20 respondents who said they use it, demonstrating the brand's broad popularity and consumer trust.

Additionally, homemade skincare products are also popular, pointing to a trend toward natural and customized skincare products. Though less prevalent than Nivea and home cures, the use of Vaseline—a well-known and multipurpose product—is noticeable.

From the survey results above, the data gathered indicates that both young and old individuals prioritize skincare, with a higher representation of females at 65.9% and males at 35.1%. 35.1% of respondents rate skincare as highly important, scoring it 9.8 out of 10.

An overwhelming majority, 93.4%, discover skincare products through social media, showcasing its significant influence. Acne remains a major concern for both genders, especially considering that 55.9% do not exfoliate often, contributing to acne problems.

Moreover, 51.9% report experiencing allergies or reactions to skincare items, possibly due to insufficient knowledge about product combinations. It's important to note that even though 60.2% opt for organic skincare, it may not always be dermatologically safe. it was potentially causing adverse reactions.

A notable concern is that 50.2% neglect the daily use of SPF, risking sunburn, and allergic reactions. The prevalence of sunburn on the face is almost equal among respondents, with a small difference between those who notice sunburn (28.6%) and those who don't (29.5%).

The majority prioritize overall health to enhance skin appearance, suggesting a comprehensive approach to skincare. These findings highlight the necessity for educating individuals about skincare routines, appropriate product combinations, and the significance of sun protection to alleviate skin-related issues among respondents.

ACKNOWLEDGMENTS

We gratefully acknowledge the essential contributions of all survey respondents and the help provided by our academic advisors. The help from our friends and family is also much appreciated.
